INTRODUCTION

The Occupational Safety and Health Act of 1970 (OSHA) became an official part of the nation's labor laws in 1971. With its passage Congress declared its intent "...to assure as far as possible every working man and woman in the Nation safe and healthful working conditions and to preserve our human resource."

In order to measure and evaluate the effectiveness of governmental efforts in reducing work related injuries and illnesses, a standardized system to collect, compile, and analyze the health and safety statistics was established and implemented. This standard system enables data users to identify those industries that need improvement, to plan future monitoring and education programs, and allow employers to compare their incidence rates with other firms in the same industry.

Under this system, employers with more than 10 workers are required to keep records of all work-related deaths; any diagnosed occupational illness; and any occupational injury which involves loss of consciousness, restriction of work or motion, transfer to another job, or requires medical treatment beyond first aid. These employers maintain a log and summary of occupational injuries and illnesses (OSHA No. 200) and supplementary record (OSHA No. 101) of each incident or occurrence within the calendar year. These records are retained at the work site for five years and must be available for inspection by representatives of the U.S. Department of Labor, the U.S. Department of Health and Human Service, or the Montana Department of Labor and Industry.

Employers with 10 or fewer employees and those employers who conduct business in one of the low-hazard industries specified by OSHA in the Federal Register notice of Dec. 28, 1982, are generally exempt from these record keeping requirements. Instead, a sample of these employers are selected to participate in the survey. Participation requires each establishment to maintain records only for that year. The data derived from these records are used only for statistical purposes. Our 1999 sample surveyed 3,522 establishments.

The Montana Department of Labor and Industry, Research and Analysis Bureau has cooperated with the U.S. Department of Labor, Bureau of Labor Statistics in conducting this annual survey which has provided these essential work injury and illness statistics over the past 20 years.

The material in this publication is in the public domain and may be reproduced without permission, as long as this agency and the Bureau of Labor Statistics are cited as the source.

In 1999, employees of Montana businesses experienced a total of 17,000 nonfatal occupational injuries and illnesses. This converts into an overall incidence rate of 7.2 accidents and illnesses per 100 full-time workers. Table 1 shows the 1999 annual average employment, number of injuries and illnesses occurring, and the corresponding incidence rates in private industry in Montana by major industry division.

Table 1. Employment, frequency, and incidence rates of nonfatal occupational injuries and illnesses in private industry in Montana, 1999.

	17.3	300	1.7
	109.4	4,800	6.1

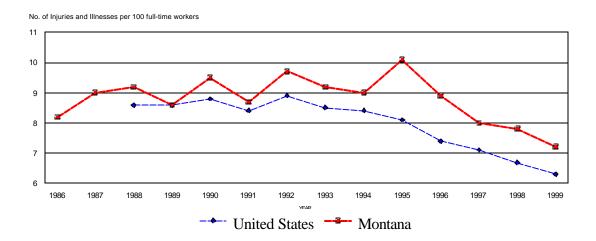

NOTE: Because of rounding, components may not add to totals.

In general, industries involved in producing goods (agriculture, mining, construction and manufacturing) normally have incidence rates of occupational injuries and illnesses which are higher than those engaged in providing services (transportation; wholesale and retail trade; finance, insurance, and real estate; and services). Mining rates are usually low because safety programs have been emphasized over the past several years.

Within the service producing industries, the finance, insurance, and real estate sector is still the safest industry sector with respect to occupational injuries and illnesses by a considerable margin.

Compared to previous years, the 1999 experience was the bwest in more than a decade. In fact, 1999 was the fourth straight year in a row where the overall rate has declined. On the other hand, Montana consistently has had higher rates than the national average. The national incidence rate for 1999 was 6.3, 13 percent below Montana's rate. See Figure 1.

Figure 1. Comparison of overall incidence rates of nonfatal occupational injuries & illnesses, Montana vs. U.S., 1986-1999.

Total lost workday cases involve days away from work, days of restricted activity, or both. It is a measure of severity of the injury or illness. Using this as a measure of severity, the injuries and illnesses reported in Montana are similar to those reported elsewhere. In Montana, an estimated 5,174 of the 17,000 cases (30 percent) involve at least one day away from work. Nationally, 30 percent of the cases reported involve at least one day away from work.

Table 2 shows the number of injuries and illnesses which involved at least one day away from work and the corresponding incidence rates in private industry in Montana in 1999 by major industry division.

The most common type of injury which involved at least one day away from work in Montana was a sprain or strain. More than half of the injuries (51.0 percent) reported involved sprains or strains. The next most common type of injury involved an unspecified soreness, pain or hurt, except the back. These were involved in 7.7 percent of these cases. In third place were fractures. They occurred 6.3 percent of the time. Employees with fractures had one of the highest median number of days away from work—25.

Table 2. Employment, frequency and incidence rates of nonfatal occupational injuries and illnesses with at least one day away from work

	Annual Average Employment (000's)	Number of Injuries & Illnesses	Rate (Number per 100 FTE Employees)
Private Industry	300.6	5,174	2.2
Goods Producing Industries			
Agriculture, Forestry, and Fishing	4.7	121	4.6
Mining	5.1	116	2.6
Construction	19.5	509	3.1
Manufacturing	24.5	631	2.7
Service Producing Industries			
Transportation and Public Utilities	18.9	552	2.7
Wholesale Trade	18.7	401	2.4
Retail Trade	82.1	1,166	2.0
Finance, Insurance and Real Estate	17.3	66	0.4
Services	109.4	1,612	2.0

NOTE: Because of rounding, components may not add to totals.

The most hazardous occupations were nursing aides, orderlies and attendants, truck drivers and non-construction laborers. Table 3 shows that nursing aides, orderlies and attendants accounted for 11.0 percent of the injuries involving days away from work. Truck drivers were responsible for 10.0 percent, and non-construction laborers, 6.5 percent. Cooks accounted for another 3.7 percent; and janitors and cleaners, 3.1 percent. Of these occupations, the one having the highest median number of days away from work was truck drivers. The median number of days away from work for an occupational injury for this group was 10 days.

Table 3—Occupations with the highest frequency of injuries and illnesses involving at least one day away from work, Montana, 1999.

Occupation	Number of Injuries	Proportion of the Total Injuries Reported (%)	Median Number of Days Away from Work
Total	5,174	100.0%	5
Nursing Aides & Orderlies	567	11.0%	5
Truck Drivers	523	10.1%	10
Non-construction Laborers	334	6.5%	4
Cashiers	191	3.7%	6
Cooks	189	3.7%	4
Janitors & Cleaners	160	3.1%	5

About 94 percent of the estimated 17,000 cases of injuries and illnesses reported in Montana in 1999 involved injuries. There were 16,000 injuries compared to 1,000 illnesses. Little variation was observed across the different industry sectors.

Of the 1,000 cases of nonfatal occupational illnesses reported in Montana in 1999, an estimated 500 involved disorders associated with repeated trauma.

Table 4. The number of nonfatal occupational injuries & illnesses and percent injuries in Montana, 1999.

	Annual Average Employment (000's)	Number of Injuries & Illnesses	Number of Injuries	Number of Illnesses	Percent Injuries

Services	109.4	4,800	4,600	300	95.8%

^{**} FEWER THAN 50 CASES

NOTE: Because of rounding, components may not add to totals.

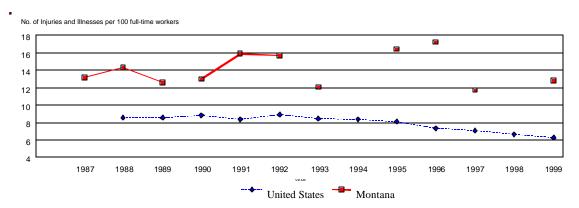

Agriculture, Forestry and Fishing

Farms and ranches with fewer than 11 employees are exempt under OSHA regulations from reporting injuries and illnesses occurring in their work areas. Since these smaller operations constitute a majority of this industry in Montana, the estimated incidence rates for this industrial sector are severely underreported.

Because of the small number of workers employed in the larger agricultural operations, it has been difficult to consistently estimate the number of occupational injuries and illnesses which occurred. In 1998, the number was too small to report. In 1999, there were about 300 cases for an incidence rate of 12.8 cases per 100 full- time workers. This rate shows agriculture to be one of the three most hazardous industries in which one can work in Montana.

Over the years, Montana has consistently reported higher incidence rates of occupational injuries and illnesses in the agriculture sector than the national average. For example, in 1999 the national incidence rate was 7.3 cases per 100 full-time workers.

Figure 2. Comparison of nonfatal occupational injuries & illnesses, agriculture, forestry & fishing industries, Montana vs. U.S., 1987-1999.

^{*}The Incidence Rate was not reported for 1994 and 1998, because data did not meet publication criteria.

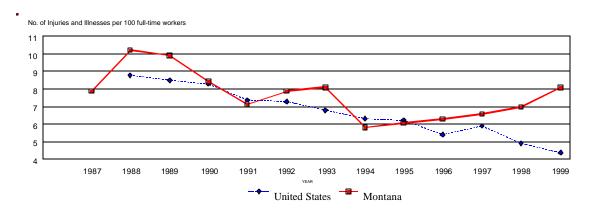

Mining

In recent years, mining has become a relatively small sector in Montana, employing about 5,100 workers. In 1999, it was estimated that there were 400 cases of nonfatal occupational injuries and illnesses among these workers.

The incidence rate of injuries and illnesses per 100 full-time workers in the mining sector in Montana has been on the rise in recent years. In 1999, it was 8.1, increasing from 7.0 in 1998; 6.6 in 1997; 6.3 in 1996; 6.1 in 1995; and 5.8 in 1994. Roughly 29 percent of these injuries & illnesses involved at least one day away from work.

In recent years, the trend of Montana's incidence rates of injuries and illnesses in the mining sector has been the opposite of the national trend. Where Montana statistics are rising, the nation's statistics are falling. Nationally, the injury and illness incidence rate for mining decreased from 5.9 cases in 1997 to 4.4 injuries and illnesses per 100 full-time workers in 1999.

Figure 3. Comparison of nonfatal occupational injuries & illnesses, mining industry, Montana vs. U.S., 1987-1999.

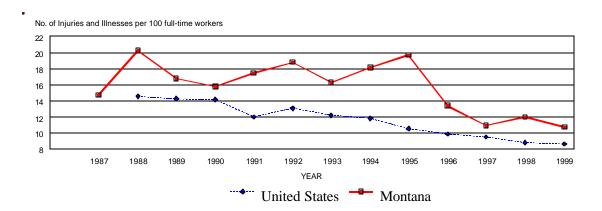

Metal mining had the highest incidence rates within the mining sector. The incidence rate for metal mining was 13.3. In contrast, the incidence rate for coal mining was 3.3 and for nonmetallic minerals mining, 4.2.

Construction

Construction is one of the three industry sectors in Montana with the highest incidence rate of injuries and illnesses per 100 full-time workers. In 1999, it was 10.8, lower than the previous rates of 12.0 in 1998 and 11.0 in 1997. Almost all of these are classified as injuries. About 30 percent of the cases were severe enough to involve at least one day away from work.

Compared to national statistics, these rates are high. Montana consistently has a higher number of injuries and illnesses than national statistics would indicate. The national incidence rate for the construction sector in 1999, for example, was 8.6 illnesses and injuries per 100 full-time workers. In Montana, general building contractors had the highest incidence rate of all construction industries surveyed in 1999, with 15.6 injuries and illnesses per 100 full-time workers. Special trade contractors followed with an incidence rate of 8.9.

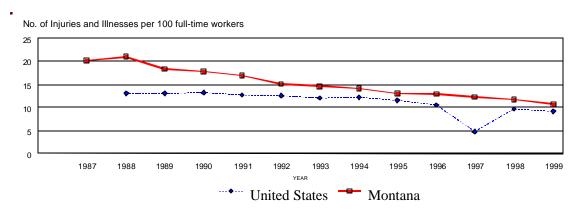

Figure 4. Comparison of nonfatal occupational injuries & illnesses, construction industry, Montana vs. U.S., 1987-1999.

Manufacturing

Over the past 10 years, the manufacturing sector in both the nation and Montana has reported significantly lower incidence rates of occupational injuries and illnesses. Although manufacturing is one of the three major industry sectors with the highest incidence rates, recent improvement has been commendable. In 1999, the Montana rate was an estimated 10.8 injuries and illnesses per 100 full-time workers, down from 11.7 in 1998.

Figure 5. Comparison of nonfatal occupational injuries & illnesses, manufacturing industry, Montana vs. U.S., 1987-1999.

Montana's incidence rates for occupational injuries and illnesses in the manufacturing sector are generally higher than the nation's. Both appear to be on the decline, and the gap is getting smaller. In 1999, the Montana rate was 10.8—17 percent more than the national rate. In 1987, this same ratio was 60 percent more (Montana—21.0; U. S.—13.1). Like the other high-incidence sectors, most (88 percent) of these cases were classified as occupational injuries instead of illnesses. About one-fourth of these involved at least one day away from work. Like the other goods producing industries, sprains, strains and tears were the most common types of injury.

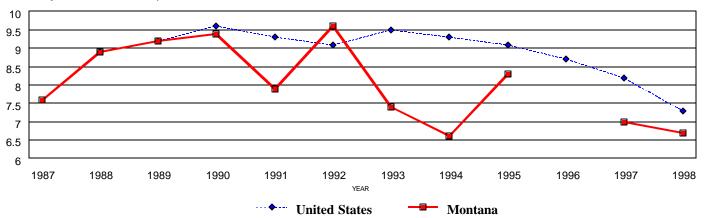

Within manufacturing, establishments in the primary metals had the highest rates of occupational injuries and illnesses. Their 1999 rate was 24.9. This was followed by the manufacture of stone, clay, and glass products (14.5) and lumber and wood products (13.2). The median number of workdays lost from an injury in the manufacturing sector was 7 days.

Transportation, Communications and Utilities

The injury and illness incidence rates for the transportation and public utilities sector for 1999 in Montana was 6.2. This is slightly lower than the rate observed in previous years. In 1998, the rate was 6.7. Nationally, the injury and illness rate for this sector has been higher than the Montana rate in recent years. In 1999, it was 7.3 injuries and illnesses per 100 full-time workers.

Figure 6. Comparison of nonfatal occupational injuries & illnesses, transportation, communications & utility industries, Montana vs. U.S., 1987-1999.

The Incidence Rate was not reported for 1996, because data did not meet publication criteria.

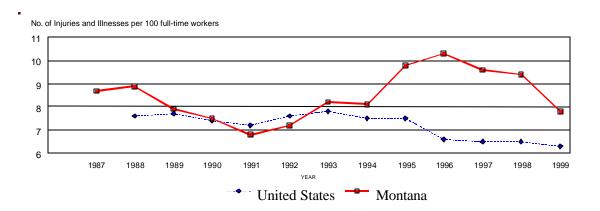

Over 92 percent of the 1999 cases involved injuries, and about 46 percent of them involved cases with lost workdays. This sector is dominated by truck drivers who reported half of the more serious cases, that is, those involving days away from work. The most common types of injuries involved sprains, strains and tears, (57 percent).

About 42 percent of the accidents occurred in Montana establishments involved in the trucking and warehousing industry. This is up substantially from the previous year, where only 33 percent of the transportation industry's occupational injuries came from the trucking and warehousing sector.

Wholesale Trade

Wholesale trade had an occupational injury and illness incidence rate of 7.8 in 1999. This rate is lower than those observed in past years. In 1998, for example, the corresponding rate was 9.4. Nationally, the injury and illness incidence rate for this industry is lower. In 1999 it was 6.3 injuries and illnesses per 100 full-time workers.

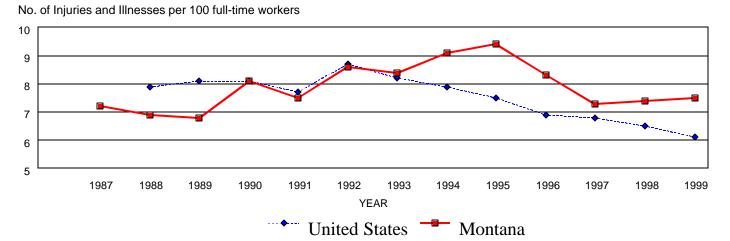

Figure 7. Comparison of nonfatal occupational injuries & illnesses, wholesale trade, Montana vs. U.S., 1987-1999.

Retail Trade

Retail trade, Montana's second largest industry group in terms of employment, reported an estimated 4,300 cases of occupational injuries and illnesses in 1999. The incidence rate was 7.5 in 1999, about the same as 1998's rate of 7.4. Nationally, the incidence rate for occupational injuries and illnesses in the retail trade sector has been lower than the state's rate in recent years. In 1999, for example, the national rate was 6.1 injuries and illnesses per 100 full-time workers.

Figure 8. Comparison of nonfatal occupational injuries & illnesses, retail trade, Montana vs. U.S., 1987-1999.

reported.

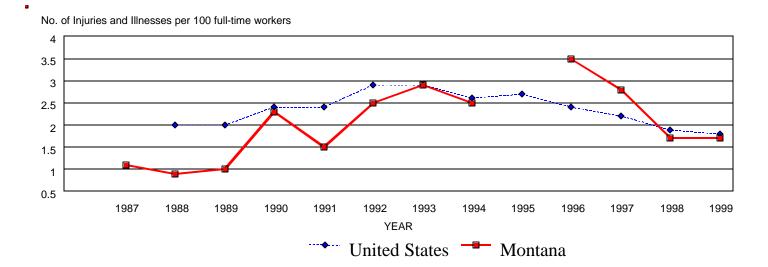

With respect to retail trade, they accounted for 96 percent of the total number of cases in 1999. The injuries and illnesses in retail trade are different in that they are not as severe. In this respect, they are similar to those reported by establishments in the wholesale trade sector. Only about 27 percent of the injuries and illnesses in the retail trade sector involve at least one day away from work. The most common type of injury was again sprains and strains.

Within the retail trade sector, building materials and garden supply stores had the highest incidence rate with 11.3 injuries and illnesses per 100 full-time workers. This was followed by automotive dealers and service stations (9.0) and food stores (8.9).

Finance, Insurance and Real Estate

Finance, insurance and real estate (FIRE) continued its history as Montana's and the nation's safest industry in 1999 with a Montana incidence rate of 1.7 injuries and illnesses per 100 full-time workers. Nationally, the injury and illness incidence rate for FIRE was 1.8.

Figure 9. Comparison of nonfatal occupational injuries & illnesses, finance, insurance, and real estate industries, Montana vs. U.S., 1987-1999.

The Incidence Rate was not reported for 1995, because data did not meet publication criteria.

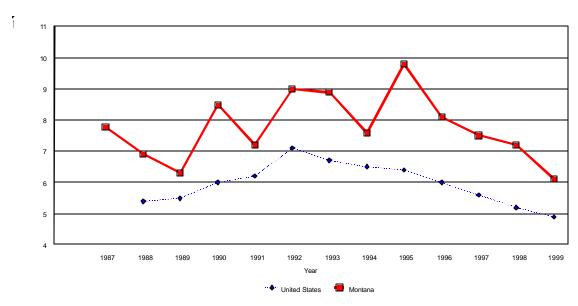

Services

Services, Montana's largest industry group in terms of employment, reported an estimated total of 4,800 nonfatal injuries and illnesses in 1999. The corresponding incidence rate was 6.1, a decrease from 1998's rate of 7.2. Nationally, the injury and illness incidence rate for the services sector has been consistently lower than the state's. In 1999, the national rate was reported to be 4.9 injuries and illnesses per 100 full-time workers. This indicates that Montana's rate is 24 percent higher than the corresponding national rate.

Workers in hotels and other lodging places had the highest incidence rate in 1999 within the services sector. Those providing personal services came in second. Establishments in these groups reported rates of 10.4 and 8.1 injuries and illnesses per 100 full-time workers, respectively.

Figure 10. Comparison of nonfatal occupational injuries & illnesses, service industries, Montana vs. U.S., 1987-1999.

¹ Incidence rates represent the number of injuries and illnesses per 100 full-time workers and were calculated as: (N/EH) x 200,000 where

N = number of injuries and illnesses

EH = total hours worked by all employees during

the calendar year

200,000 = base for 100 equivalent full-time workers

(working 40 hours per week, 50 weeks per year).

NOTE: Because of rounding, components may not add to totals. n.e.c. = not elsewhere classified.

-- Indicates data not available.

² Totals include data for industries not shown separately.

³ Standard Industrial Classification Manual, 1987 Edition.

⁴ Employment is expressed as an annual average and is derived primarily from the BLS-State Covered Employment and Wages program.

⁵ Total lost workday cases involve days away from work, or days of restricted work activity, or both.

⁶ Days-away-from-work cases include those which result in days away from work with or without restricted work activity.

⁷ Excludes farms with fewer than 11 employees.

⁸ Data conforming to OSHA definitions for mining operators in coal, metal, and nonmetal mining and for employers in railroad transportation are provided to BLS by the Mine Safety and Health Administration, U.S. Department of Labor; and the Federal Railroad Administration, U.S. Department of Transportation. Independent mining contractors are excluded from the coal, metal, and nonmetal mining industries.

⁹ Incidence rate less than 0.05.

Table 3. Incidence rates' of nonfatal occupational injuries by industry division and employment size, 1999

	All	Establishment employment size (workers)

 $^{^{1}}$ Incidence rates represent the number of injuries and illnesses per 10,000 full-time workers and were calculated as: (N/EH) x 20,000,000 where

N = number of injuries and illnesses

EH = total hours worked by all employees during calendar year

20,000,000 = base for 10,000 equivalent full-time workers

(working 40 hours per week, 50 weeks per year).

by the Federal Railroad Administration, U.S. Department of Transportation. Independent mining contractors are excluded from the coal, metal, and nonmetal industries.

NOTE: Dashes indicate data that are not available or data for incidence rates less than 1.0 per 10,000 full-time workers. Major classifications may include detailed classifications not shown separately.

n.e.c. = not elsewhere classified.

² Days-away-from-work cases include those which result in days away from work with or without restricted work activity.

³ Excludes farms with fewer than 11 employees.

⁴ Data conforming to OSHA definitions for mining operators in coal, metal, and nonmetal mining and for employers in railroad transportation are provided to BLS by the Mine Safety and Health Administration, U.S. Department of Labor; and

¹ Days-away-from-work cases include those which result in days away from work with or without restricted work activity.

NOTE: Dashes indicate data that are not available. Because of rounding, data may not sum to the totals. Major classifications may include detailed classifications not shown separately. n.e.c. = not elsewhere classified.

² Excludes farms with fewer than 11 employees.

³ Data conforming to OSHA definitions for mining operators in coal, metal, and nonmetal mining and for employers in railroad transportation are provided to BLS by the Mine Safety and Health Administration, U.S. Department of Labor; and by the Federal Railroad Administration, U.S. Department of Transportation. Independent mining contractors are excluded from the coal, metal, and nonmetal industries.

¹ Days-away-from-work cases include those which result in days away from work with or without restricted work activity.

NOTE: Dashes indicate data that are not available. Because of rounding, percentages may not add to 100. Major classifications may include detailed classifications not shown separately.

n.e.c. = not elsewhere classified.

Report Form and Instructions Used in the 1998 Survey

This is available in separate PDF document

Appendix E

Glossary of Terms

Annual summary - Consists of a copy of the occupational injury and illness totals for the year from the OSHA No.200, and the following information: the calendar year covered, company name, establishment address, certification signature, title, and date.

Annual survey - Each year BLS conducts an annual survey of occupational injuries and illnesses to produce national statistics. The OSHA injury and illness records maintained by employers in their establishments serve as the basis for this survey.

Cooperative program - A program jointly conducted by the states and the federal government to collect occupational injury and illness statistics.

Employee - One who is employed in the business of his or her employer affecting commerce.

Employer - Any person engaged in a business affecting commerce that has employees.

Establishment - A single physical location where business is conducted or where services or industrial operations are performed; the place where the employees report for work, operate from or from which they are paid.

Exposure - The reasonable likelihood that a worker is or was subject to some effect, influence or safety hazard; or in contact with a hazardous chemical or physical agent at a sufficient concentration and duration to produce an illness.

Federal Register - The official source of information and notification on OSHA's proposed rulemaking, standards, regulations and other official matters, including amendments, corrections, insertions or deletions.

First aid - Any one-time treatment and subsequent observation of minor scratches, cuts, burns, splinters, and so forth, which do not ordinarily require medical care. Such treatment and observation are considered first aid even though provided by a physician or registered professional personnel.

First report of injury - A workers' compensation form which may qualify as a substitute for the supplementary record, OSHA No.101.

Hours Worked - The total hours worked by all employees during the report period. Includes all time on duty, but does not include vacations, holidays, sick leave, and all other nonwork time even though paid.

Incidence rate - The number of injuries, illnesses or lost workdays related to a common exposure base of 100 full-time workers. The common exposure base enables one to make accurate interindustry comparisons, trend analysis over time, or comparisons among firms regardless of size.

Log and Summary - (OSHA No.200) The OSHA recordkeeping form used to list injuries and illness, also to note the extent of each case.

Lost workday cases - Cases that involve days away from work or days of restricted work activity, or both.

Lost workdays - The number of workdays (consecutive or not) beyond the day of injury or onset of illness the employee was away from work or limited to restricted work activity because of an occupational injury or illness.

Lost workdays-away from work - The number of workdays (consecutive or not) on which the employee would have worked but could not because of occupational injury or illness. The number of days away from work or days of restricted work activity does not include the day of injury or onset of illness, or any days on which the employee would not have worked even though able to work.

Lost workdays-restricted work activity - The number of workdays (consecutive or not) on which, because of injury or illness: (1) the employee was assigned to another job on a temporary basis; or (2) the employee worked at a permanent job less than full time; or (3) the employee worked at a permanently assigned job but could not perform all duties normally connected with it. The number of days away from work or days of restricted work activity does not include the day of injury or onset of illness or any days on which the employee would not have worked even though able to work.

Low-hazard industries - Selected industries in retail trade; finance, insurance and real estate; and services which are regularly exempt from OSHA record keeping. To be included in this exemption, an industry must fall within an SIC not targeted for general schedule inspections and must

have an average lost workday case injury rate for a designated 3-year measurement period at or below 75 percent of the U.S. private sector average rate.

Medical treatment - Includes treatment of injuries administered by physicians, registered professional personnel or lay persons (i.e., non-medical personnel). Medical treatment does not include first aid treatment (one-time treatment and subsequent observation of minor scratches, cuts burns, splinters, and so forth, which do not ordinarily require medical care) even though provided by a physician or registered professional personnel.

Occupational Illness - Any abnormal condition or disorder, other than one resulting from an occupational injury, caused by exposure to environmental factors associated with employment. It includes acute and chronic illnesses or diseases which may be caused by inhalation, absorption, ingestion or direct contact.

Occupational skin diseases or disorders - Examples are: contact dermatitis, eczema or rash caused by primary irritants and sensitizers or poisonous plants; oil acne; chrome ulcers; chemical burns or inflammations; etc.

Dust diseases of the lungs - Examples are: silicosis, asbestosis and other asbestos-related diseases, coal worker's pneumoconiosis, byssinosis, siderosis and other pneumoconioses.

Respiratory conditions due to toxic agents - Examples are: pneumonitis, pharyngitis, rhinitis or acute congestion due to chemicals, dusts, gases, or fumes, farmer's lung, etc.

Poisoning - Systemic effects of toxic materials Examples are: poisoning by lead, mercury, cadmium, arsenic or other metals; poisoning by carbon monoxide, hydrogen sulfide or other gases; poisoning by benzol, carbon tetrachloride or other organic solvents; poisoning by insecticide sprays such as parathion and lead arsenate; poisoning by other chemicals such as formaldehyde, plastics and resins; etc.

Disorders due to physical agents - Other than toxic materials. Examples are: heatstroke, sunstroke, heat exhaustion and other effects

of environmental heat; freezing, frostbite and effects of exposure to low temperatures; cais son disease; effects of ionizing radiation (isotopes, X-rays, radium); effects of nonionizing radiation (welding flash, ultraviolet rays, microwaves, sunburn), etc.

Disorders associated with repeated trauma - Examples are: noise-induced hearing loss; synovitis, tenosynovitis, and bursitis; Raynaud's phenomena; and other conditions due to repeated motion, vibration, or pressure.

All other occupational illnesse - Examples are: anthrax, brucellosis, infectious hepatitis, malignant and benign tumors, food poisoning, histoplasmosis, coccidioidomycosis, etc.

Occupational Injury - Any injury such as a cut, fracture, sprain, amputation, etc., which results from a work accident or from a single instantaneous exposure in the work environment. Note: Conditions resulting from animal bites, such as insect or snakebites, and from one-time exposure to chemicals are considered to be injuries.

Occupational Safety and Health Administration (OSHA) - OSHA is responsible for developing, implementing and enforcing safety and health standards and regulations. OSHA works with employers and employees to foster effective safety and health programs which reduce workplace hazards.

Recordable cases - All work-related deaths and illnesses and those work-related injuries which result in loss of consciousness, restriction of work or motion, transfer to another job, or require medical treatment beyond first aid.

Regularly exempt employers - Employers regularly exempt from OSHA recordkeeping include but are not limited to employers in retail trade; finance, insurance, and real estate; and services industries; i.e., SICs 52-89 (except building materials and garden supplies, SIC 52; general merchandise and food stores, SICs 53 and 54; hotels and other lodging places, SIC 70; repair services, SICs 75 and 76; amusement and recreation services, SIC 79; and health services, SIC 80); and all employers with no more than 10 full- or part-time employees at any one time in the previous calendar year. (Note: Some state safety and health laws may require these employers to keep OSHA records.)

Restriction of work or motion - Occurs when the employee, because of the result of a job-related injury or illness, is physically or mentally unable to perform all or any part of his or her normal assignment during all or any part of the workday or shift.

Standard Industrial Classification (SIC) - A classification system developed by the Office of Statistical Standards, Executive Office of the President/Office of Management and Budget for use in classifying establishments by the type of activity in which they are engaged. Each establishment is assigned an industry code for its major activity which is determined by the product or group of products produced or services rendered. Establishments may be classified in two-digit, three-digit or four-digit industries according to the degree of information available.

Supplementary Record (OSHA No.101) - The form (or equivalent) on which additional information is recorded for each injury and illness entered on the log.

Usable Units - Those units for which all reported data have been manually and mechanically screened and found acceptable.

Volunteers - Workers who are not considered to be employees under the act when they serve of their own free will without compensation.

Work environment - Consists of the employer's premises and other locations where employees are engaged in work-related activities or are present as a condition of their employment. The work environment includes not only physical locations, but also the equipment or materials used by the employee during the course of his or her work.

Scope and Methodology of Survey

Scope

The Survey of Occupational Injuries and Illnesses provides annual estimates of the frequency (incidence rates) and number of occupational injuries and illnesses based on logs kept by private industry employers. These logs reflect the year's injury and illness incidents and the employers understanding of which cases were work related, under current recordkeeping guidelines provided by the U.S. Department of Labor. The number of injuries and illnesses reported in any given year may be influenced by changes in the level of economic activity, working conditions and work practices, number of hours worked, and worker experience and training.

The survey includes the following industries: agriculture, forestry and fishing, SIC 01-09; oil and gas extraction, SIC 13; sulfur mining, part of SIC 14; construction, SIC 15-17; manufacturing, SIC 20-39; transportation and public utilities, SIC 41-42 and 44-49; wholesale and retail trade, SIC 50-59; finance, insurance and real estate, SIC 60-67; and services, SIC 70-87 and 89. Excluded from the survey are self-employed individuals; farms with fewer than 11 employees; employers regulated by other federal safety and health laws, and federal, state and local government agencies.

Data conforming to definitions of recordable occupational injuries and illnesses for coal, metal and nonmetal mining, and railroad transportation are provided by the Mine Safety and Health Administration, Department of Labor, and the Federal Railroad Administration, Department of Transportation.

The Occupational Safety and Health Administration is responsible for the collection and compilation of comparable data for federal agencies. State and local government agencies are not surveyed for national estimates. Several states have legislation that enables them to collect data for this sector; Montana is not one of these states.

The 1997 survey sample in Montana was composed of approximately 3,200 sample units. Original and follow-up mailings resulted in a response rate of 97 percent. From the selected establishments, approximately 1,840 injuries and illnesses with days away from work were used in order to obtain demographic and detailed case characteristic information.

Sample

A two-stage sample selection process generates the survey estimates. The first stage involves selecting establishments. The second stage involves selecting the sample of cases involving days away from work which is derived from the sample establishments.

Because the survey is a federal-state cooperative program and the data must meet the needs of participating state agencies, an independent sample is selected for each state. The sample is selected to represent all private industries in the state. The sample size for the survey is dependent upon (1) the characteristics for which estimates are needed, (2) the industries for which estimates are desired, (3) the characteristics of the population being sampled, (4) the target reliability of the estimates, and (5) the survey design employed.

For the establishment selection process, the total number of lost workdays is used as the base for the sample design. The sample design is based on lost workday cases because it is considered the most important characteristic of the sample.

The important features of the sample design are its use of stratified random sampling with a Neyman allocation and a ratio estimator. The characteristics used to stratify the establishments are the Standard Industrial Classification code and employment. Because these characteristics are highly correlated with an establishment's number and rate of reported injuries and illnesses, stratified sampling provides greater precision and, thus, results in a smaller sample size than simple random sampling. The Neyman allocation produces the minimum sample size which will provide an estimate with a fixed sampling variance. For the largest employment size classes, the allocation procedure places all of the establishments of the frame in the sample; as employment decreases smaller and smaller proportions of establishments are included in the sample. The certainty strata are usually the size groups with 1,000 employees or more. The precision of the sample is further improved hence permitting reduction in sample size by using the ratio estimator, which in turn uses employment data that are correlated with the characteristics that are to be measured.

The national sample is designed to produce data at the 2-digit SIC industry level in agriculture, forestry, and fishing; the 3-digit level in oil and gas extraction; construction; transportation and public utilities; wholesale and retail trade; finance, insurance and real estate; and services; and the 4-digit level in manufacturing.

The sample of cases involving days away from work is derived from the sampled establishments. For each sample unit, an expected number of cases involving days away from work is calculated based on the industry and employment size in which that establishment resides. If the expected number of cases is greater than 20, the establishment is requested to provide demographically detailed case characteristics information, and the number of workdays missed for cases occurring at specified time intervals (for example, certain days of the month, only certain months). For those establishments with an expected case load less than or equal to 20, the employer is requested to provide case information for all cases involving days away from work occurring in the survey year. Either way, employers are permitted to attach supplementary forms that answer questions about individual days-away-from-work cases.

Estimating procedures

Sample unit weighting. By means of a weighting procedure, sample units represent all units in their size class for a particular industry. The weight is determined by the inverse of the sampling ratio for the industry employment-size class from which the unit was selected. Because a small proportion of survey forms were not returned, weights of responding employers in a sampling cell are adjusted to account for the nonrespondents. The respondents are then shifted into the estimating cell determined by the employment reported. Data for each unit are multiplied by the appropriate weight and nonresponse adjustment factor. The products are then aggregated to obtained a total for the estimating cell.

Industry Benchmarking. Because the universe file that provides the sample frame is not current

to the reference year of the survey, it is necessary to adjust the data to reflect current employment levels. In the survey, all estimates of totals are adjusted by the benchmark factor at the estimating cell level. The benchmarking procedure requires a source of accurate employment data that can be converted into an annual average employment figure for the cell level in which separate estimates are desired. Because industry/employment size data are required for national estimates, benchmark factors are calculated using both industry level employment data and size class level employment data. The benchmark factors are applied to the size class estimates.

Weighting cases involving days away from work. Each case involving days away from work is weighted by the sample unit weight with which it is associated and the industry benchmark factor in which the associated sample unit resides. In addition, each case is weighted to adjust for case subsampling and case nonresponse for those establishments which did not provide information on all cases with days away from work which occurred in their establishment in the survey year.

Federal-state cooperation

To eliminate duplicate reporting by respondents and to ensure maximum comparability of estimates, survey respondents complete one reporting form which is then used for national and state estimates.

Industrial classification

Reporting units are classified into industries by their principal product or activity based on the 1987 edition of the Standard Industrial Classification Manual. The data are tabulated according to this SIC scheme. In the trucking and warehousing and transportation by air industries, SIC coding changes that were introduced with the 1996 BLS-State Covered Employment and Wages program were incorporated into the estimates for this survey. Because of these changes, estimates for 1996 and later for the following industries are not comparable to the estimates for prior years: trucking and warehousing (SIC 42; transportation by air (SIC 45); and transportation services (SIC 47). In addition, the 1996 and later estimates for transportation and public utilities may have more variability than those for prior years.

Reliability of estimates

The survey estimates of occupational injuries and illnesses are based on a scientifically selected probability sample, rather than a census of the entire population. These sample-based estimates may differ from the results obtained from a census of the population. The sample used was one of many possible samples, each of which could have produced different estimates. The variation in the sample estimates across all possible samples that could have been drawn is measured by the relative standard error. The relative standard error is used to calculate a "confidence interval" around a sample estimate.

The 95-percent confidence interval is the interval centered at the sample estimate and includes all values within two times the estimate's standard error. If several different samples were selected to estimate the population value (for example, injury and illness incidence rates), the 95-percent

confidence interval would include the true population value approximately 95 percent of the time.

The relative standard errors for the rate of injuries and illnesses are calculated for national estimates only. They are not available at the state level.

Nonsampling error

Although not measured, nonsampling error will always occur when statistics are gathered. The inability to obtain information about all cases in the sample, mistakes in recording or coding the data, and definitional difficulties are general examples of nonsampling error in the survey. The Bureau of Labor Statistics has implemented quality assurance procedures to reduce nonsampling error in the survey, including a rigorous training program for state coders, mechanical edits that identify questionable entries, and a continuing effort to encourage survey participants to respond fully and accurately to all survey elements.

Recent survey modifications

Beginning with the 1995 survey, modifications were made in the methodology used to adjust for survey nonresponse and data outliers and to benchmark the survey results. These changes were found to have minimal impact on the survey estimates.

Publication guidelines

The estimating procedure generates occupational injury and illness estimates for many hundreds of SIC codes. This publication, however, excludes estimates for industry codes if one of the following situations occurred:

- · The industry had fewer than six employees or the industry estimates were based on reports from fewer than three companies. In addition, if three or more companies reported data from the industry, one firm could not employ more than 60 percent of the workers.
- · Annual average employment for the industry in 1997 was less than 10,000. However, data for an industry with an annual average employment of less than 10,000 were published if the majority of the employment was reported in the survey.
- The relative standard error on total lost workday cases for the industry exceeds a specified limit.
- The benchmark factor for the industry was less than 0.90 or greater than 1.49.
- The publication might disclose confidential information.

Data for an unpublished industry are included in the total for the broader industry level of which it is a part. Also, selected items of data are suppressed for publishable industries if the sampling error for the estimate exceeds a specified limit, typically 60 percent at the national level.

For the case characteristics and demographic data, items of data were suppressed at a national level if one of the following situations occurred:

- The number of cases was less than five.
- The number of cases was greater than five and less than or equal to 20 and the sampling error for the estimate was unusually high, typically exceeding 60 percent.
- The number of cases was greater than 20 and the sampling error was unusually high, typically exceeding 40 percent.
